My competitors are creating content around premium agarbatti, daily puja products, natural incense sticks, and fragrance-based agarbatti keywords. They are ranking for many informational and commercial keywords that my website does not currently target. I discovered that keywords like “natural agarbatti” and “sandal agarbatti” have lower competition and good ranking opportunities. My plan is to create SEO blogs, product pages, and category pages targeting these keywords. I will also optimize my website using long-tail keywords, better meta descriptions, and internal linking. This strategy will help improve my organic traffic and compete with top agarbatti brands in India.

PRACTICAL TASK: L12 — Get 50 Keyword Ideas from ChatGPT

3 Observations: ChatGPT Estimated Data vs Ubersuggest Real Data

1. **Search Volume was close for long-tail keywords**
   ChatGPT’s estimated search volumes were mostly similar for niche long-tail keywords like “dhoop vs agarbatti difference” and “natural agarbatti vs charcoal agarbatti.” This shows AI can predict keyword demand direction reasonably well. (Ubersuggest)
2. **SEO Difficulty (SD) scores can vary a lot**
   Ubersuggest calculates SD using its own algorithm and local ranking data, so actual SD scores may differ from AI estimates. Many SEO experts also mention that keyword difficulty scores are not always perfectly accurate across tools. (Ubersuggest)

3. **AI estimates are useful for planning, not final SEO decisions**
   ChatGPT helped generate relevant keywords and approximate opportunities quickly, but real SEO tools like Ubersuggest are still needed to validate:
   - Actual monthly volume
   - Competition level
   - CPC
   - Ranking difficulty
     Best practice is to use AI for ideation and Ubersuggest for validation.
   - (Ubersuggest)
